

How to install the **APL smart** and **Safety Cross** sensor

The sensor is dedicated to the detection of pedestrians close to the pedestrian crossings.

Follow carefully the instructions below:

- **Mounting height: 3m**
- Sensor placement:
 - The offset distance from the axis of the crossing must be **from 2m to 2,5m** anticipating the pedestrian crossing from the driver's point of view.
 - The sensor should be positioned as close as possible to the crossing to create a "**detection area**" parallel to pedestrian crossing stripes in order to avoid the creation of blind spots or the activation of the system by vehicles.

How not install sensor
